

Remote Core Logging Facility for Hire

Since 2010, MineGeoTech has supported Australian and International exploration and mining companies that require Geotechnical, Mine Planning and Optimisation services.

The MGT remote core logging facility is a 20ft air-conditioned refrigerated sea-container. It is primarily set up for the geological and geotechnical logging of diamond core, but has multiple other uses. It can be set up in two days by a two-person assembly team.

The facility:

- provides for a productive and safe work environment, particularly the management of hot work conditions with shade provided with roller racks
- is set up as a stand-alone facility with 27m of roller racking that can be configured to suit nearly any specific situation, including integration with client core yard
- has a 9m angle iron for core orientation, suitable for daily support of a single drill rig
- has pre-wired internal and external power and lighting, requiring a 32A 3-phase power supply
- is configured for a range of core photography options
- can be provided with Telstra connectivity via a 5m mast and CelFi Go if the site is within range of a Telstra tower
